# On the Classification of Self-Dual $\mathbb{Z}_{\boldsymbol{k}}$-Codes II 

Masaaki HARADA ${ }^{1, *}$ and Akihiro MUNEMASA ${ }^{2}$<br>${ }^{1}$ Research Center for Pure and Applied Mathematics, Graduate School of Information Sciences, Tohoku University, Sendai 980-8579, Japan<br>${ }^{2}$ Research Center for Pure and Applied Mathematics, Graduate School of Information Sciences, Tohoku University, Sendai 980-8579, Japan

In this short note, we report the classification of self-dual $\mathbb{Z}_{k}$-codes of length $n$ for $k \leq 24$ and $n \leq 9$.
KEYWORDS: self-dual code, frame, unimodular lattice

## 1. Introduction

Let $\mathbb{Z}_{k}$ be the ring of integers modulo $k$, where $k$ is a positive integer greater than 1 . A $\mathbb{Z}_{k}$-code $C$ of length $n$ is a $\mathbb{Z}_{k}$-submodule of $\mathbb{Z}_{k}^{n}$. A code $C$ is self-dual if $C=C^{\perp}$, where the dual code $C^{\perp}$ of $C$ is defined as $C^{\perp}=\left\{x \in \mathbb{Z}_{k}^{n} \mid\right.$ $x \cdot y=0$ for all $y \in C\}$ under the standard inner product $x \cdot y$. Two $\mathbb{Z}_{k}$-codes $C$ and $C^{\prime}$ are equivalent if there exists a monomial $( \pm 1,0)$-matrix $P$ with $C^{\prime}=C \cdot P$, where $C \cdot P=\{x P \mid x \in C\}$. A Type $I I \mathbb{Z}_{2 k}$-code was defined in [2] as a self-dual code with the property that all Euclidean weights are divisible by $4 k$ (see [2] for the definition of Euclidean weights). It is known that a Type II $\mathbb{Z}_{2 k}$-code of length $n$ exists if and only if $n$ is divisible by eight [2]. A self-dual code which is not Type II is called Type I.

As described in [24], self-dual codes are an important class of linear codes for both theoretical and practical reasons. It is a fundamental problem to classify self-dual codes. Much work has been done towards classifying self-dual $\mathbb{Z}_{k}$-codes for small $k$ and modest $n$ (see [24]). Let $n_{\max }(k)$ denote the maximum integer $n$ such that self-dual $\mathbb{Z}_{k}$-codes are classified up to length $n$. For $k=2,3, \ldots, 10$, we list in Table 1 our present state of knowledge about $n_{\max }(k)$. We also list the reference for the classification of self-dual $\mathbb{Z}_{k}$-codes of length $n_{\max }(k)$.

A classification method of self-dual $\mathbb{Z}_{k}$-codes based on a classification of $k$-frames of unimodular lattices was given by the authors and Venkov [14]. Then, in [12], using this method, self-dual $\mathbb{Z}_{k}$-codes were classified for $k=$ $4,6,8,9,10$ (see Table 1). Using the same method, in this short note, we complete the classification of self-dual codes $\mathbb{Z}_{k}$-codes of length $n$ for $k \leq 24$ and $n \leq 9$. All computer calculations in this short note were done by MAGMA [4].

## 2. Classification of self-dual $\mathbb{Z}_{\boldsymbol{k}}$-codes

### 2.1 Method for classifications

A classification method of self-dual $\mathbb{Z}_{k}$-codes based on a classification of $k$-frames of unimodular lattices was given by the authors and Venkov [14]. We describe it briefly here (see [12] and [14] for undefined terms and details).

A set $\left\{f_{1}, \ldots, f_{n}\right\}$ of $n$ vectors $f_{1}, \ldots, f_{n}$ in an $n$-dimensional unimodular lattice $L$ with $\left(f_{i}, f_{j}\right)=k \delta_{i, j}$ is called a $k$-frame of $L$, where $(x, y)$ denotes the standard inner product of $\mathbb{R}^{n}$, and $\delta_{i, j}$ is the Kronecker delta. The following construction of lattices from codes is called Construction $A$. If $C$ is a self-dual $\mathbb{Z}_{k}$-code of length $n$ then

[^0]$$
A_{k}(C)=\frac{1}{\sqrt{k}}\left\{\left(x_{1}, \ldots, x_{n}\right) \in \mathbb{Z}^{n} \mid\left(x_{1} \bmod k, \ldots, x_{n} \bmod k\right) \in C\right\}
$$
is an $n$-dimensional unimodular lattice. Moreover, $C$ is Type II if and only if $A_{k}(C)$ is even. Let $\mathcal{F}=\left\{f_{1}, \ldots, f_{n}\right\}$ be a $k$-frame of $L$. Consider the mapping
\[

$$
\begin{aligned}
& \pi_{\mathcal{F}}: \frac{1}{k} \bigoplus_{i=1}^{n} \mathbb{Z} f_{i} \rightarrow \mathbb{Z}_{k}^{n} \\
& \pi_{\mathcal{F}}(x)=\left(\left(x, f_{i}\right) \bmod k\right)_{1 \leq i \leq n} .
\end{aligned}
$$
\]

Then $\operatorname{Ker} \pi_{\mathcal{F}}=\bigoplus_{i=1}^{n} \mathbb{Z} f_{i} \subset L$, so the code $C=\pi_{\mathcal{F}}(L)$ satisfies $\pi_{\mathcal{F}}^{-1}(C)=L$. This implies $A_{k}(C) \simeq L$, and every code $C$ with $A_{k}(C) \simeq L$ is obtained as $\pi_{\mathcal{F}}(L)$ for some $k$-frame $\mathcal{F}$ of $L$, where $L \simeq L^{\prime}$ means that $L$ and $L^{\prime}$ are isomorphic lattices. Moreover, every Type I (resp. Type II) $\mathbb{Z}_{k}$-code of length $n$ can be obtained from a certain $k$-frame in some $n$-dimensional odd (resp. even) unimodular lattice.

Let $L$ be an $n$-dimensional unimodular lattice, and let $\mathcal{F}=\left\{f_{1}, \ldots, f_{n}\right\}, \mathcal{F}^{\prime}=\left\{f_{1}^{\prime}, \ldots, f_{n}^{\prime}\right\}$ be $k$-frames of $L$. Then the self-dual codes $\pi_{\mathcal{F}}(L)$ and $\pi_{\mathcal{F}^{\prime}}(L)$ are equivalent if and only if there exists an automorphism $P$ of $L$ such that $\left\{ \pm f_{1}, \ldots, \pm f_{n}\right\} \cdot P=\left\{ \pm f_{1}^{\prime}, \ldots, \pm f_{n}^{\prime}\right\}[14]$. This implies that the classification of codes $C$ satisfying $A_{k}(C) \simeq L$ reduces to finding a set of representatives of $k$-frames in $L$ up to the action of the automorphism group of $L$.

### 2.2 Results

Here, we report the classification of self-dual $\mathbb{Z}_{k}$-codes of length $n$ for $k \leq 24$ and $n \leq 9$. Our classification method of self-dual $\mathbb{Z}_{k}$-codes of length $n$ requires a classification of $n$-dimensional unimodular lattices. For $n \leq 7$, any $n$-dimensional unimodular lattice is isomorphic to $\mathbb{Z}^{n}$. Up to isomorphism, there are two 8-dimensional unimodular lattices, one of which is the even unimodular lattice denoted by $E_{8}$ and the other is $\mathbb{Z}^{8}$. Also, up to isomorphism, there are two 9-dimensional unimodular lattices, $\mathbb{Z}^{9}$ and $E_{8} \oplus \mathbb{Z}$ (see [7, p. 49]).

In Table 2, we list the number of inequivalent self-dual $\mathbb{Z}_{k}$-codes $C$ with $A_{k}(C) \simeq L$ for $k \in\{2,3, \ldots, 24\}$ and $L \in\left\{\mathbb{Z}^{i} \mid i=1,2, \ldots, 9\right\} \cup\left\{E_{8}, E_{8} \oplus \mathbb{Z}\right\}$. Note that all self-dual $\mathbb{Z}_{k}$-codes $C$ with $A_{k}(C) \simeq E_{8}$ are Type II. A classification of self-dual $\mathbb{Z}_{k}$-codes of lengths $n \leq 9$ was known for some $k$. In this case, we list the references in the last columns of the table. Generator matrices can be obtained electronically from [13]. All the zero entries in Table 2 are explained as follows. For $k \in\{3,6,7,11,12,14,15,19,21,22,23,24\}$, if there is a self-dual $\mathbb{Z}_{k}$-code of length $n$, then $n$ is divisible by four (see [9, Corollary 2.2]). For $k \in\{2,5,8,10,13,17,18,20\}$, if there is a self-dual $\mathbb{Z}_{k}$-code of length $n$, then $n$ is even (see [8, Theorem 4.2], [9, Corollary 2.2]). If $k$ is a square, then there is a self-dual $\mathbb{Z}_{k}$-code for every length (see [6], [8]). If a self-dual $\mathbb{Z}_{k}$-code is Type II, then $k$ is even.

### 2.3 Remark on length 4

A classification of self-dual $\mathbb{Z}_{k}$-codes of length 4 was given in [3] for $k=19,23$, and in [21] for prime $k \leq 100$. We note that the definition of equivalence employed in [21] is different from our definition. Let $N_{4}(k)$ denote the number of inequivalent self-dual $\mathbb{Z}_{k}$-codes of length 4 . We give in Table 3 the numbers $N_{4}(k)$ for integers $k$ with $25 \leq k \leq 200$. We remark that the classification can be extended to $k=1000$. However, in order to save space, we do not list the result.

Table 3. Classification of self-dual $\mathbb{Z}_{k}$-codes of length 4 ( $25 \leq k \leq 200$ ).

| $k$ | $N_{4}(k)$ | $k$ | $N_{4}(k)$ | $k$ | $N_{4}(k)$ | $k$ | $N_{4}(k)$ | $k$ | $N_{4}(k)$ | $k$ | $N_{4}($ k $)$ |

Let $s_{1}, s_{2}, \ldots, s_{u}$ be positive integers. An orthogonal design of order $n$ and of type ( $s_{1}, s_{2}, \ldots, s_{u}$ ), denoted $O D\left(n ; s_{1}, s_{2}, \ldots, s_{u}\right)$, on the commuting variables $x_{1}, x_{2}, \ldots, x_{u}$ is an $n \times n$ matrix $A$ with entries from $\left\{0, \pm x_{1}, \pm x_{2}, \ldots, \pm x_{u}\right\}$ such that

$$
A A^{T}=\left(\sum_{i=1}^{u} s_{i} x_{i}^{2}\right) I_{n},
$$

where $A^{T}$ denotes the transpose of $A$ and $I_{n}$ is the identity matrix of order $n$. The following matrix

$$
M\left(x_{1}, x_{2}, x_{3}, x_{4}\right)=\left(\begin{array}{rrrr}
x_{1} & x_{2} & x_{3} & x_{4} \\
-x_{2} & x_{1} & -x_{4} & x_{3} \\
-x_{3} & x_{4} & x_{1} & -x_{2} \\
-x_{4} & -x_{3} & x_{2} & x_{1}
\end{array}\right)
$$

is well known as an $O D(4 ; 1,1,1,1)$. From Lagrange's theorem on sums of squares, for each positive integer $k$, the matrix $M$ gives a $k$-frame of $\mathbb{Z}^{4}$. However, there are $k$-frames which are not obtained in this way. Indeed, if $k$ is a square, then a $k$-frame can be obtained from a $k$-frame of $\mathbb{Z}^{3}$, for example,

$$
\mathcal{F}_{9}=\{(1,2,2,0),(-2,-1,2,0),(-2,2,-1,0),(0,0,0,3)\}
$$

is a 9 -frame. Although the following matrix

$$
N\left(x_{1}, x_{2}, x_{3}, x_{4}\right)=\left(\begin{array}{rrrr}
x_{1} & x_{2} & x_{3} & x_{4} \\
-x_{2} & x_{1} & -x_{4} & x_{3} \\
x_{4} & -x_{3} & x_{1} & x_{2} \\
x_{3} & x_{4} & -x_{2} & x_{1}
\end{array}\right)
$$

is not an orthogonal design, if $x_{1} x_{3}+x_{1} x_{4}-x_{2} x_{3}+x_{2} x_{4}=0$ then

$$
N\left(x_{1}, x_{2}, x_{3}, x_{4}\right) N\left(x_{1}, x_{2}, x_{3}, x_{4}\right)^{T}=\left(\sum_{i=1}^{4} x_{i}^{2}\right) I_{4}
$$

A 15 -frame $\mathcal{F}_{15}$ is obtained from $N(3,1,2,-1)$. We also found the following 21-frame $\mathcal{F}_{21}$ :

$$
\mathcal{F}_{21}=\{(4,1,0,2),(0,-4,1,2),(1,0,4,-2),(-2,2,2,3)\} .
$$

Note that $N_{4}(9)=3, N_{4}(15)=2$ and $N_{4}(21)=3$. The two other 9 -frames are obtained from $M(3,0,0,0)$ and $M(2,2,1,0)$. The other 15 -frame is obtained from $M(3,2,1,1)$. The two other 21 -frames are obtained from $M(0,1,2,4)$ and $M(2,2,2,3)$.

### 2.4 Remark on length 8

Let $N_{8, I}(2 k)$ (resp. $N_{8, I I}(2 k)$ ) be the number of inequivalent Type I (resp. Type II) $\mathbb{Z}_{2 k}$-codes of length 8 . From Table 2, we see $N_{8, I}(2)=N_{8, I I}(2)$ and $N_{8, I}(2 k)>N_{8, I I}(2 k)(k=2,3, \ldots, 12)$. We conjecture that $N_{8, I}(2 k)>N_{8, I I}(2 k)$ for all integers $k$ with $k \geq 2$.
